
Outcome: Cadre Harmonise (West Africa, 2014-26) and IPC (2017-26) area classifications, independent of FEWS NET's own maps. Shock index: rainfall deficits (CHIRPS), political violence events and deaths (ACLED, sub-national for 19 countries) and cereal price changes (WFP markets), all measured before the analysis month, weighted to predict classifications in other countries (leave-one-country-out). Coverage: annual FEWS NET reporting before 2025 (one- and two-year archive gaps filled); monthly reports from 2025 (shutdown January-July 2025, staggered restoration). All regressions: area and country x month fixed effects; 95% intervals clustered by country.
