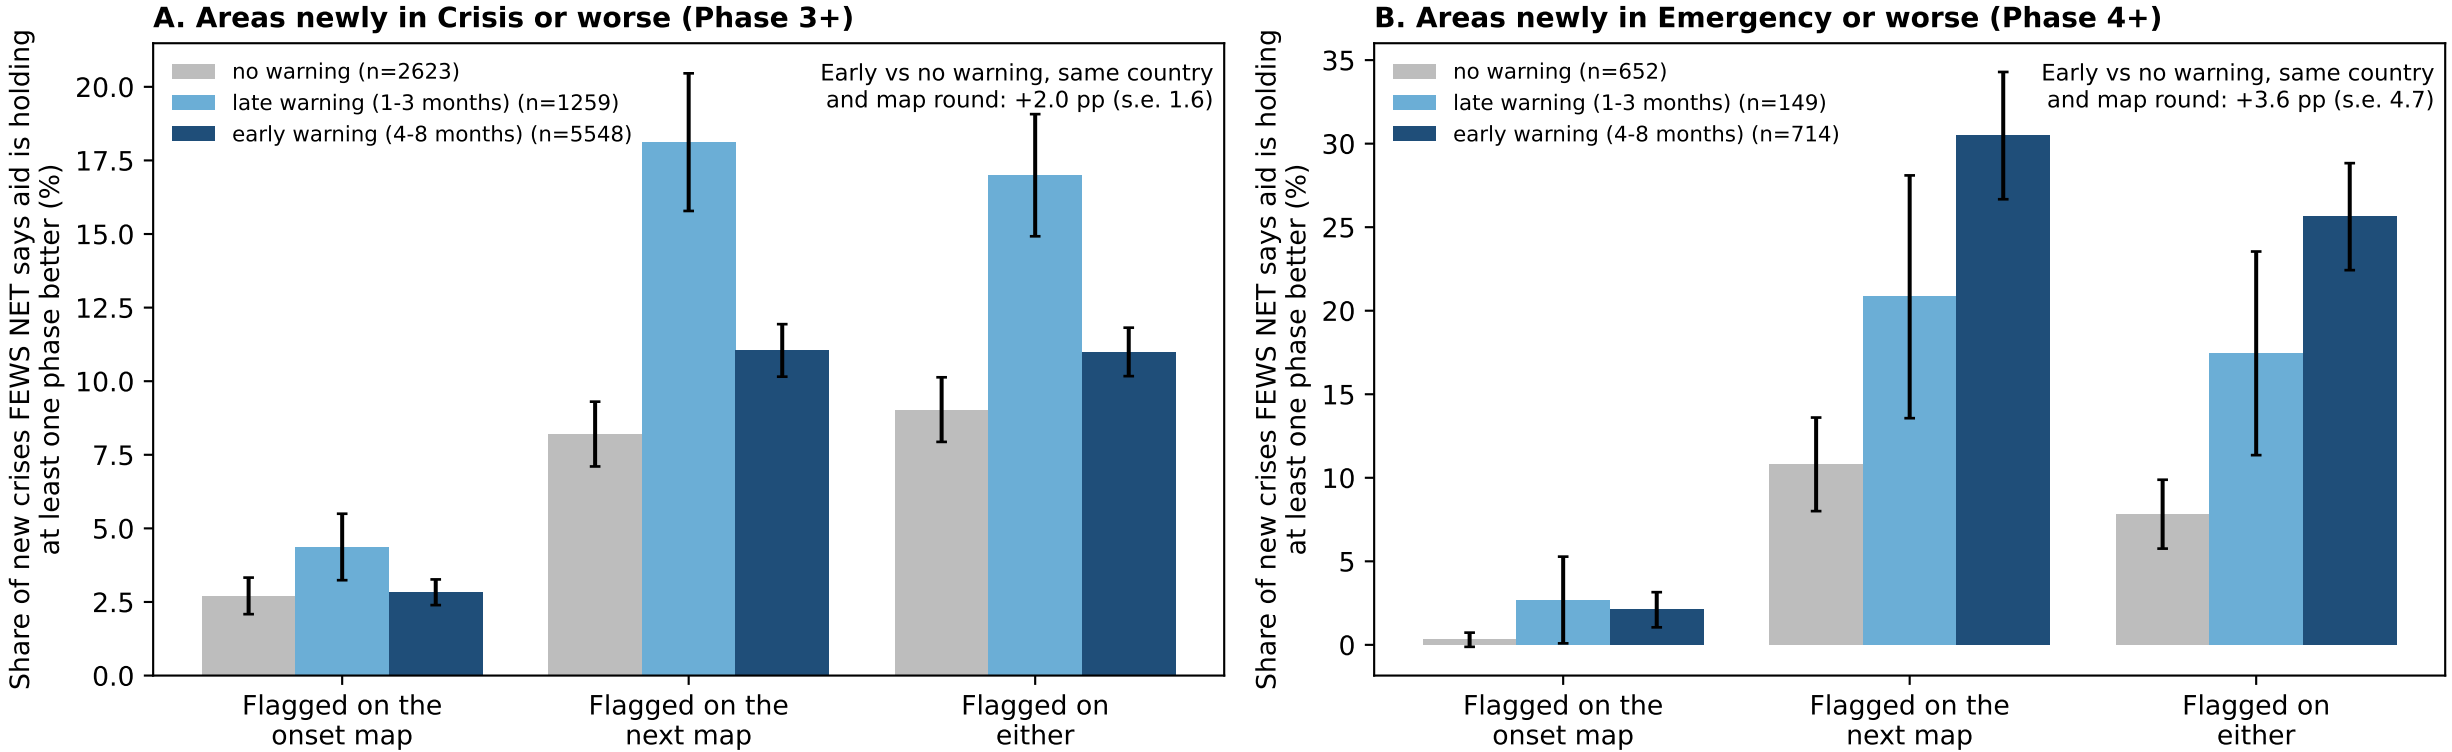
Are crises FEWS NET warned about early more often held back by aid, by FEWS NET's own judgment?



FEWS NET current-situation maps, 2011-2024. A new crisis is an area at the phase shown whose previous map (within 6 months) was below it. Early warning: a forecast issued 4-8 months before reached that phase; late: only forecasts issued 1-3 months before did; no warning: none did (onsets with no forecast issued 4-8 months before are excluded). Flag: FEWS NET marks the area '!' when humanitarian assistance keeps it at least one phase better than it would otherwise be. 95% intervals for raw shares; the regression estimate compares onsets in the same country, map round and phase, clustered by country.
