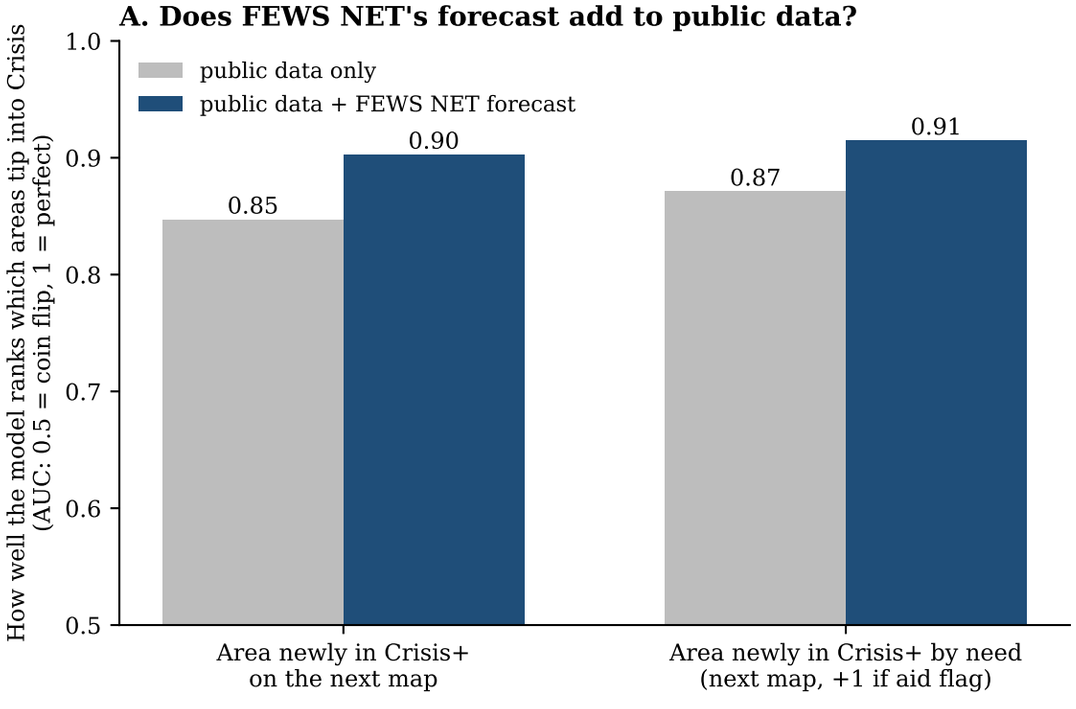
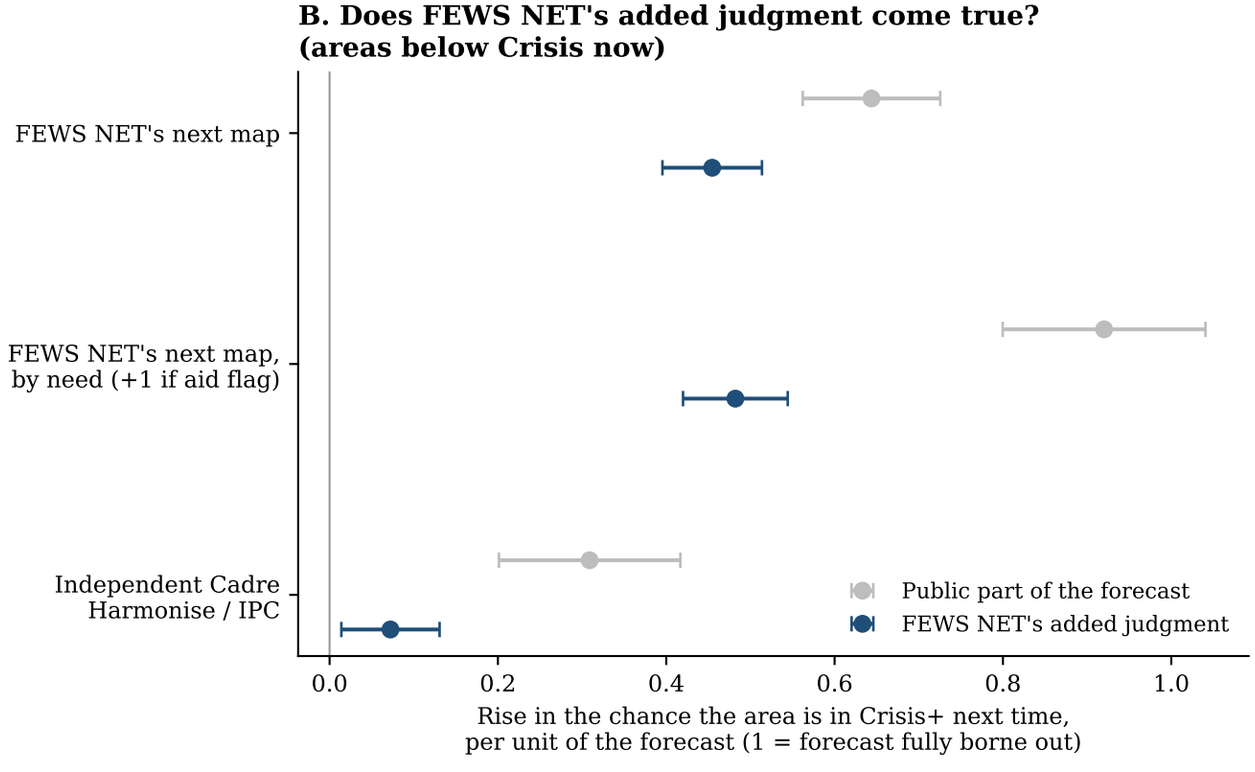
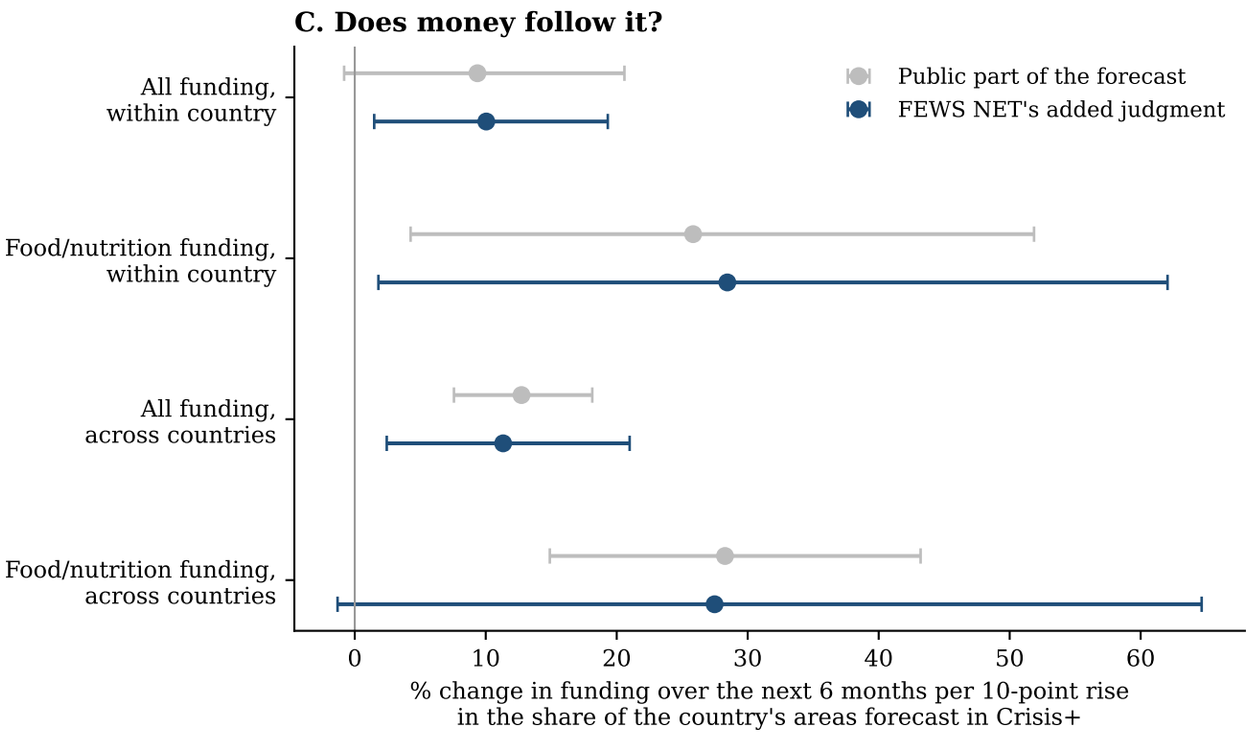
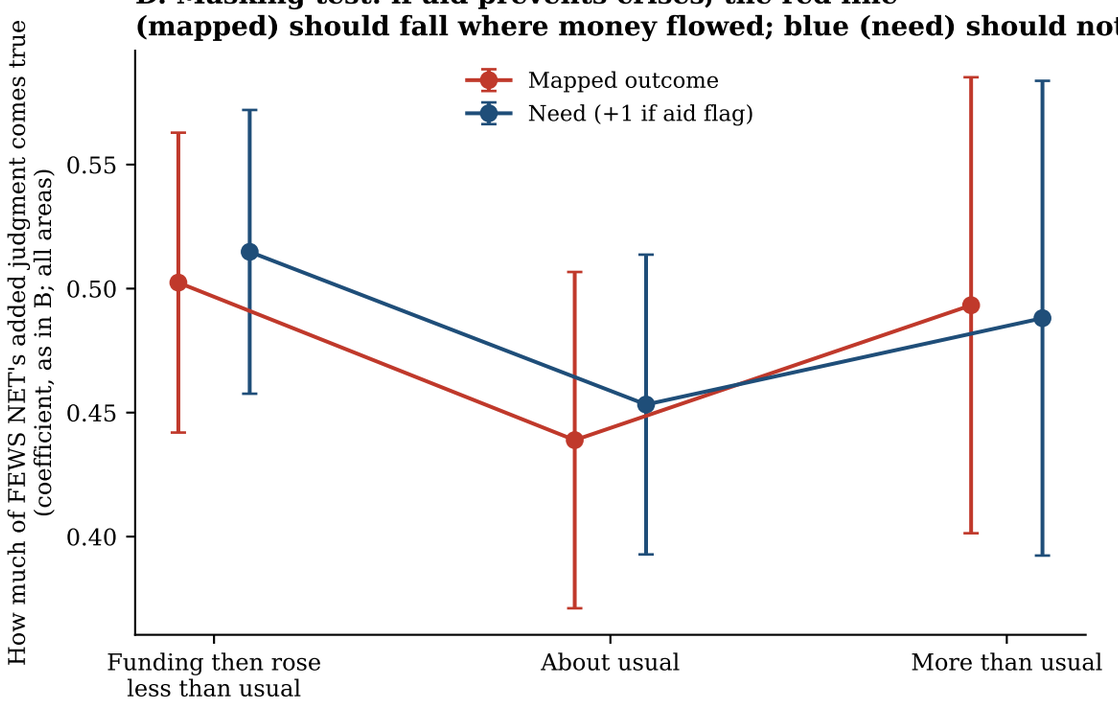
Does FEWS NET know something public data don't, and does money follow it? (2011-2024)









FEWS NET areas x map rounds. Forecast: Crisis or worse (Phase 3+) in the medium-term projection for the month of the area's next map. Public part: out-of-year prediction of that forecast from the area's current and two previous maps (phase and aid flag), the country's current share in Crisis, country and season, and local rainfall (CHIRPS), political violence (ACLED) and cereal prices (WFP) before the forecast. Added judgment = forecast minus public part. B: area and country x round comparisons, clustered by country; the Cadre Harmonise / IPC check also controls for the latest independent analysis. C: country x round, with funding in the previous 6 months. D: funding surprise = funding in the next 6 months relative to the country's usual level and recent funding.
