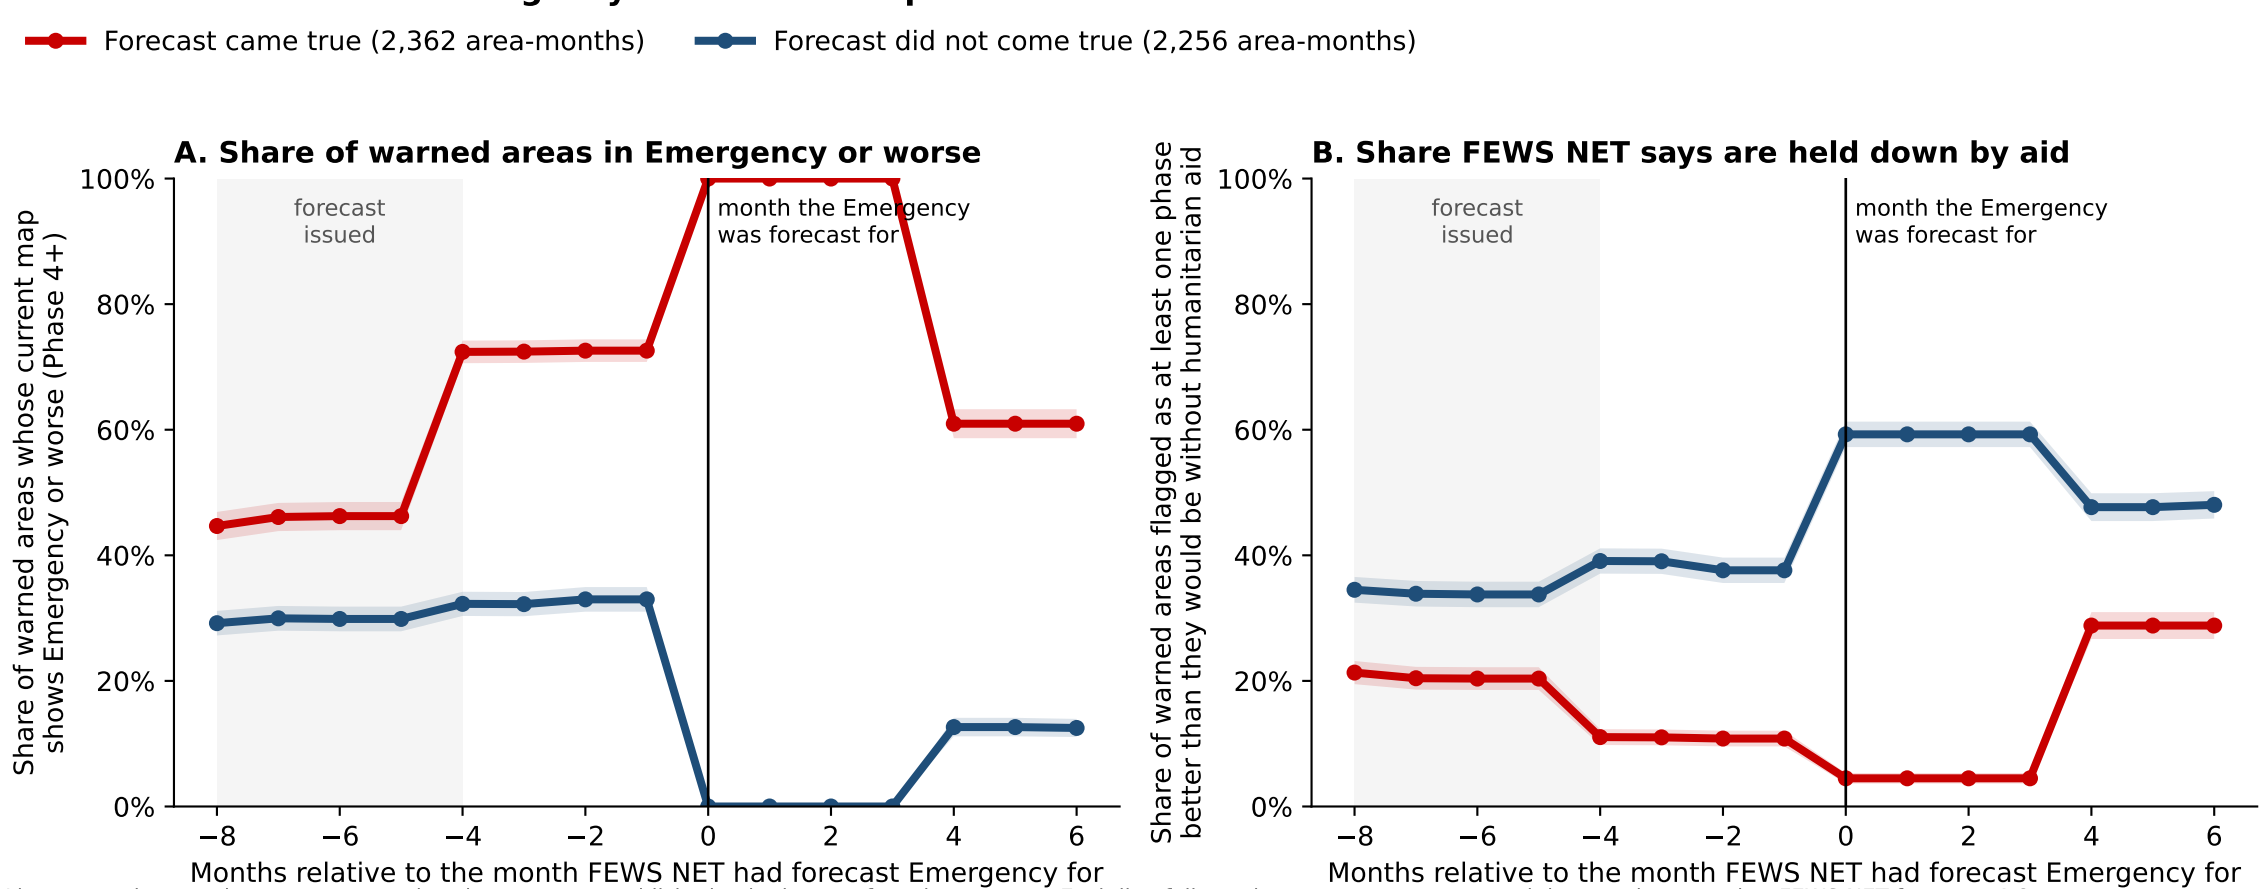
Areas forecast to be in Emergency: what their maps showed before and after the forecast month



Lines move in steps because current-situation maps are published only three or four times a year. Each line follows the same map areas month by month: areas that FEWS NET forecast, 4-8 months ahead, to be in Emergency in month 0 (2011-2026). In each month the area's most recent current-situation map (up to three months old) is used. "Held down by aid" is FEWS NET's own flag that the area would be at least one phase worse without humanitarian assistance. Bands: 95% intervals, not adjusted for clustering. Source: FEWS NET classifications and forecasts (IPC scale).
